Australia second estimate of the 1935-36 wheat crop placed at 140,000,000 bushels as compared with the first estimate of 135,000,000 bushels and the 1934-35 crop of 133,489,000 bushels. (International Institute of Agriculture, Rome, November 29, 1935.)

At London wool sales on November 29 the tone of the market was excellent. Russian, German, Swiss, French, and Belgian buyers were taking merinos and some greasy crossbreds, with Yorkshire making a few purchases of warp wool. British buyers took mostly crossbreds, with a few 54's and slipes going to the United States. Compared with preceding week, greasy and scoured merinos were at par. Fine greasy crossbreds were 2.5 percent higher, medium and low greasy crossbreds 2.5 to 5 percent, and fine, medium, and low scoured crossbreds 2.5 percent higher. Slipes of all qualities were at par. (Agricultural Attaché C. C. Taylor, London, November 29, 1935.)

## CROP AND MARKET PROSPECTS

-----

## BREAD GRAINS

The 1935 wheat crop of the Prairie Provinces of Canada

The second estimate of the 1935 wheat production of the Prairie Provinces of Canada is placed at 256,000,000 bushels, according to the Dominion Bureau of Statistics. This is 16,000,000 bushels under the September estimate and 7,800,000 bushels smaller than the 1934 crop, but the actual outturn for this season is still uncertain, since it has been unusually difficult to make estimates. Threshing returns substantiated early estimates of rust damage, but frost has injured the crop more than was expected.

The movement to market of 1935 wheat began much later than that of 1934, but by the ninth week of the new season the cumulative marketings exceeded the total for the corresponding period of 1934. By November 1, total deliveries and platform loadings amounted to 146,899,210 bushels as compared with 140,427,423 bushels on the corresponding date of 1934. Manitoba supplied 9 percent, Saskatchewan 56, and Alberta 35 percent.

It is not yet known how much wheat damaged by rust or frost will be used on farms for seed and feed during 1935-36. In Manitoba and Saskatchewan, however, many farmers are selling their 1935 crop and depending upon old wheat or the purchase of better wheat for their 1936 seed. Consequently, it seems probable that a higher percentage of the 1935 crop will be marketed than is usually the case. With marketings approximating the 1934-35 level, two thirds of the season's total have already gone forward.

Estimates of the grading of the 1935 wheat crop bear out earlier reports of the low quality and agree with actual inspection records to date. See table, page 792. The poorest outturn is indicated in Manitoba, where nearly one half of the crop was classed as "feed" and 36 percent fell into the third group containing Nos. 5 and 6 and special grades. The Saskatchewan crop showed great variation by districts, and the effects of frost and rust did not lower the average so much. While only 15 percent was classed as feed, 59 percent fell in the middle groups, leaving only 26 percent in the highest grades. The wheat of Alberta gave the highest percentage of the best grades but also had 23 percent classed as feed. Southern and eastern districts suffered very little from rust and frost, but in the north the effects of frost were very marked.

Argentine wheat supplies

In a recent investigation of Argentine grain stocks, carried out under the direction of the Ministry of Agriculture, it was found that the surplus of wheat available for export on November 7, 1935, totaled about 26,270,000 bushels as against about 40,000,000 bushels on the same date last year, according to a report from Agricultural Attaché P.O. Nyhus at Buenos Aires. To the 1934-35 crop, placed at 240,669,000 bushels, the carryover on January 1, 1935 of 15,403,000 bushels was added, giving total supplies of 256,072,000 bushels. Domestic utilization for 1935 was placed at 91,859,000 bushels, of which seed requirements were estimated at 18,372,000 bushels. If shipments during November and December amount to the usual percentage of total annual exports made in these two months, the carryover of old-crop wheat on January 1, 1936, will approximate 12,000,000 bushels. This, together with the much smaller crop expected this year, indicates a substantial reduction in Argentine supplies for 1936.

The Shanghai wheat market

Wheat and flour prices advanced rapidly on the Shanghai market late in the week ended November 22, according to a radiogram from the Shanghai office of the Foreign Agricultural Service. Local flour stocks declined and domestic wheat supplies became increasingly difficult to obtain. At current quotations, it was thought that purchases of foreign wheat would soon be made, since local prices were approaching a level favorable for import business. No wheat was imported into Shanghai during October, and up to November 22 no bookings had been made for November or December delivery. Indications point to reduced imports for the 1935-36 season as a whole as compared with the total for 1934-35. Local flour prices were higher than they had been since February 1931, having increased during September-November as a result of the short domestic wheat crop, high world prices, and the recent currency inflation. Other food prices, however, did not show proportionate gains. Mills were operating at 45-percent capacity, with flour stocks below normal at 300,000 bags.

Prices of Australian wheat, c.i.f. Shanghai duty included, for January shipment, were quoted as follows: New South Wales, 88 cents per bushel, South Australia 89 cents. Domestic standard wheat for December delivery was 83 cents per bushel. Domestic flour for November delivery was 92 cents per bag of 49 pounds, December 93, and January 94 cents; Australian flour, c.i.f. Hong Kong, \$3.33 per barrel of 196 pounds.

## CROP AND MARKET PROSPECTS, CONT'D

-----  
FEED GRAINSSummary of recent feed-grain information

No new estimates of feed grain production have been received during the week. The 1935 barley production in the 35 countries so far reported remains at 1,289,958,000 bushels compared with 1,167,957,000 bushels in 1934 when these countries accounted for a little over 83 percent of the estimated Northern Hemisphere total, exclusive of Russia and China.

The production of oats in the 28 countries reported to date remains at 3,159,686,000 bushels compared with 2,441,300,000 bushels in 1934 when these countries represented nearly 94 percent of the estimated Northern Hemisphere total, exclusive of Russia and China.

The estimated corn production in the 13 countries so far reported is 2,791,407,000 bushels compared with 2,099,523,000 bushels for the same countries in 1934 when they accounted for more than 82 percent of the estimated Northern Hemisphere total, exclusive of Russia. The sowing of the new corn crop in Argentina is proceeding under excellent conditions, although frosts and cold weather have retarded somewhat the germination of the seed already planted.

A table showing the 1935 production estimates for barley, oats and corn will be found on page 793. Feed grain prices and movement are given on page 796.

Argentine corn surplus reduced

Although the 1934-35 Argentine corn crop was the largest on record, domestic consumption has been so much above normal that the supply available for export has been materially reduced from earlier expectations, according to a report received from Agricultural Attaché P. O. Nyhus at Buenos Aires. In a recent investigation of stocks originated by the Ministry of Agriculture and carried out by the Bureau of Rural Economy and Statistics, the production estimate was verified, and it was found that domestic consumption had been more than double the usual amount. This was attributed to the fact that large quantities of corn have been used for feeding purposes as a result of the drought which prevailed in some districts from early April to late September. The low prices quoted on corn in the crib during this period no doubt contributed to its use as feed and accounted for part of the increase in domestic consumption.

With a carry-over on April 1, 1935, of 445,000 bushels added to the 1934-35 crop of 450,762,000 bushels, total corn supplies amounted to 451,207,000 bushels. Domestic consumption has been estimated in former

## C R O P   A N D   M A R K E T   P R O S P E C T S ,   C O N T ' D

years at 49,000,000 bushels and seed requirements at 5,900,000 bushels, which would indicate an exportable surplus of about 396,000,000 bushels. With domestic requirements now placed at 95,270,000 bushels, the surplus for export is reduced to about 350,000,000 bushels. This is, however, considerably above actual exports of recent years. The total exports for 1934-35 amounted to 209,541,000 bushels and the average for the preceding five years, 252,760,000 bushels.

## COTTON

Uncertainty in European cotton textile industry

The European cotton situation showed no definitive trend during October, according to a report from Agricultural Attaché L. V. Steere at Berlin. Developments varied considerably from Country to country, but with improvements on the one hand generally offset by quieter tendencies elsewhere. Uncertainty and peculiarity of price movements incident to the war between Italy and Ethiopia as well as the League decision on sanctions were disturbing influences, but do not appear as yet to have disrupted trade as a whole.

Sales of cotton yarn and cotton fabrics by spinning and cloth mills were, in general, satisfactory and on the upgrade throughout the month in England and France, but new business developments in Central Europe were less favorable. The situation in Austria remains good, but Czechoslovakia continues to report a very unfavorable level of new orders. Business in Germany is on rather favorable but slightly declining levels. The Italian situation is difficult to appraise. It seems that pre-sanction purchases of raw cotton were high, but that current yarn and fabric sales of the mills are already being affected by declining purchasing power of consumers. Deliveries for military purposes have apparently not fully offset the decline in the ordinary distribution to the civil population.

Activity of the mills is reported to have increased in England as well as in France, but seems to be slackening in Central Europe; no information is available on the position in Italy. It seems probable, however, that Italy's strenuous efforts to economize on raw materials have tended toward a reduction in Italian cotton-mill activity. The general level of occupation in Germany and Austria is still rather satisfactory; German difficulties in obtaining raw materials do not as yet seem to have impaired significantly the occupation of the mills.

Spinner and dealer buying of raw cotton was reported quite active during October in England, where trade demand was healthy and rather effectively counterbalanced the hedge-selling pressure usual at this time

## C R O P   A N D   M A R K E T   P R O S P E C T S ,   C O N T ' D

- - - - -

of the year. In France, spinner and trade buying of raw cotton was also on quite favorable levels, partly under the influence of rising raw prices. In Italy, raw buying seems to have been particularly active as a result of the threat of sanctions. Italian demand, it was stated in press reports, was particularly active for Egyptian cotton for immediate shipment. Demand for raw cotton by German spinners and merchants also showed a pick-up during October, a notable feature being that American cotton figured more in German buying than it has for many months.

The development of prices of American and other cottons since the beginning of the season has been distinctly in favor of increased takings of American cotton, with prices of Indian as well as Egyptian and exotic growths showing a considerable price increase relative to American staples. The recent advance in Egyptian cotton, probably under the influence of the heavy Italian demand, has been mainly in Sakellaridis, the advance for Egyptian Uppers being less pronounced and at times even showing a downward movement. The price position of American cotton is now more favorable than it has been for a long time, and trade as well as press comments indicate that as a result there has been a shift in demand in favor of American as compared with the demand for other growths.

Quotations of the "basis" for American cotton, as reported by a number of continental merchants, have not shown significant changes during the month of October. These quotations are now almost on the same level as at the beginning of August, with possibly a slight reduction in the "basis" for longer staples of the better grades.

All Soviet reports continue to comment favorably upon this year's cotton crop and to stress the fact that the cotton-producing regions are well able to exceed the Government cotton-procuring plan. The original cotton-procuring plan announced on September 12, 1935, provides for a total quantity of 1,515,000 metric tons of unginned cotton, equivalent to approximately 2,300,000 bales of lint, to be procured this season. The Berlin office still considers the yield implied by this figure too high, although a yield materially higher than that of 1934 and above that of 1933 is to be expected. It is pointed out that the increase in yield has resulted not from particularly favorable weather conditions, but from improved technique due to better organization. Temperatures during most of the growing period were below those of 1933 and, following a period of hot weather in August, declined sharply in September to below normal and even below September 1934. Moreover, the previously reported shortage of water in the irrigated cotton regions of the Union is also confirmed.

The different operations of cotton cultivation, it is stated, were carried out and completed in a more satisfactory way than during preceding

## CROP AND MARKET PROSPECTS, CONT'D

years. Although improved cultivation of cotton no doubt characterized 1935 as compared with 1933 and 1934, there is still room for further improvement as is evidenced by the numerous complaints of the Soviet press, throughout the growing period, of various defects in the cotton-growing and irrigation work. Cotton procurings are proceeding at a more rapid rate than in 1934, when the development was unsatisfactory, and also than in 1933. The procuring plan was about 75 percent completed by October 25 this year as compared with less than half procured at the same date in 1934, and 56 percent delivered on October 25, 1933.

## FRUIT, VEGETABLES, AND NUTS

Mediterranean Basin citrus supplies uncertain

Oranges and mandarins available for export during the 1935-36 season from the Mediterranean Basin countries are expected to be around 35,000,000 boxes (70-pound basis), or about the same as in the last two seasons, according to the Paris office of the Foreign Agricultural Service. A smaller crop than usual is expected in Spain, but Palestine is harvesting a bumper crop. Average crops are expected in both Algeria and Italy.

The trend of orange production in Mediterranean countries is upward. Present young groves indicate that increases in production may be expected in Palestine and Spain for the next decade. Not much change is anticipated in Italy and Algeria. Exports from the Mediterranean region may be expected to increase rapidly during the next five years. If demand continues to expand, exports may be expected to increase over a longer period of years. The proportion of the crop used as fresh fruit will not be as high if consumption fails to increase as fast as prospective production.

The 1935 lemon crop in Italy is expected to be larger than the 1934 crop of 11,300,000 boxes (74 pound basis). A fairly good crop of winter lemons is expected this year in Sicily, although production on the whole is tending downward because of the inroads of the "mal secco" disease. Highest prices for several years prevailed last summer. This is explained by a rather light Italian winter-lemon crop, which made it possible for summer (Verdeli) lemons to go into consumption rapidly; an early summer heat wave, which stimulated lemon consumption; the purchase of lemons by the Italian government for the army; and the exaggerated rumors of the quantities purchased for the army which reached other consuming countries.

## CROP AND MARKET PROSPECTS, CONT'D

-----

Small quantities of lemons are produced in Spain, Tripoli, Palestine, and other Mediterranean countries. The increase in these supplies is not large enough at present to offset the decline in Italian production occasioned by the "mal secco".

If the free flow of Italian citrus products is not permitted this season due to sanctions, there may be some change in the international flow of citrus products. Countries which ordinarily receive citrus fruits from Italy will be forced to look elsewhere. Most of the Italian orange and mandarin exports have usually gone to Germany, Austria, Hungary, and Switzerland. On the other hand, Italian lemons are much more widely distributed, with the United Kingdom and Germany the principal outlets. Cutting off the supply of these lemons would tax lemon-producing countries of the world, notably the United States, to make up even as much as half of the Italian trade in lemons.

Cuban winter vegetables approximate last year's crops

Preliminary estimates indicate that the Cuban winter vegetable crop, for which the United States is the principal export market, will in the coming season approximate the size of the crop of 1934, according to Harold S. Tewell, American Consul, Habana, Cuba. Tomatoes constitute the largest single vegetable crop grown in Cuba for foreign markets. The quantity available for export for 1935 has been placed at between 1,300,000 and 1,400,000 lugs (about 28 pounds each, net weight) as compared with exports of 1,373,000 lugs from last year's crop and 1,050,000 lugs from 1933. It is reported that shipments to the United States will not reach appreciable volume until after December 1. While tomato seed beds this year covered a larger acreage than in 1934, unusually dry weather during the summer months, attended by a wide-spread insect infestation, greatly curtailed planting. The crop however, has not been affected by recent hurricanes.

The crop of lima beans this winter is estimated to be about 50 percent larger than last year, when exports to American markets totaled 92,000 hampers (about 32 pounds each, net weight) or approximately the same as in 1933. Shipments to the United States from the present crop, however, are not expected greatly to exceed the volume attained last winter owing to the efforts being made to maintain quality standards, according to the Vice Consul. Shippers report that exports of peppers from the present crop may be slightly less than in the last two years, although it is said to be too early in the season to estimate closely the size of the crop and the probable exports during the coming winter. Last winter's pepper crop was approximately 35,500 crates (about 40 pounds each, net weight).

Cucumbers constitute the principal winter vegetable crop of the Isle of Pines, where the main Cuban crop of that commodity is grown. An area

## C R O P   A N D   M A R K E T   P R O S P E C T S ,   C O N T ' D

-----

of 775 acres has been planted with cucumbers on the Isle of Pines this year, as compared with about 600 acres last year, and, depending on growing conditions, will produce between 80 and 100 crates of commercial cucumbers to the acre. A good crop is expected this year, growing conditions having been favorable. Shipments of cucumbers to American markets last winter amounted to 30,300 crates (about 45 pounds each, net weight) against 31,600 crates in the preceding winter.

Shipments of eggplant to the United States from Cuba from last year's crop totaled 72,890 crates (about 45 pounds each, net weight). Preliminary estimates place the trade during the coming winter months at 75,000 to 78,000 crates. While the domestic market is the principal outlet for Cuban okra, a growing demand in the United States, coupled with greater production, forms the basis for the estimated shipments of about 50,000 crates (about 32 pounds each, net weight). The Cuban early potato crop, which usually matures in January, is expected to amount to about 500,000 bushels as compared with a production of 700,000 bushels in the early crop of 1935.

-----

LIVESTOCK, MEAT, AND WOOL

Brisk competition at London wool sales

Competition at the last series of the London wool sales for 1935, which opened on November 19, has continued brisk and confident for all descriptions, according to a cable from Agricultural Attache C. C. Taylor at London. Compared with closing prices of the preceding series on October 4, quotations on November 25 were 10 percent higher for greasy merinos and 7.5 to 10 percent higher for scoured merinos. Prices being paid for fine greasy crossbreds were 10 percent higher, those for medium greasy crossbreds 15 percent higher, and those for low greasy crossbreds 10 percent higher. Fine scoured crossbreds were being purchased at an advance of 5 percent, and medium and low scoured crossbreds at an advance of 7.5 percent over October 4 closing rates. Fine lamb's wool slipes were selling 15 percent higher and all other slipes 10 percent higher.

Great Britain is buying offerings of all types of crossbreds and some merinos. Buyers from Switzerland, France, Belgium, the Netherlands, and Central Europe are showing considerable interest in average warp and scoured merinos and 56's and 48's crossbreds. Russia thus far is interested mainly in best greasy merinos. Representatives of American dealers are showing most interest in best slipes.

-----

## AGRICULTURAL IMPORTS OF THE UNITED STATES, 1934-35

Agricultural imports in 1934-35 show an increase in value over the total for the preceding year and the value is greater than it has been since the export year 1930-31. (See table, page 773.) This advance in total value has not been evenly distributed throughout the list of agricultural products imported, certain commodities having increased sharply and others having decreased materially. In the following table is presented a summary of the important individual farm products included in the total of agricultural imports. Together they account for nearly three fourths of all farm imports. The divergent movements of the products listed below show the irregularity in advances and decreases of agricultural imports last year.

UNITED STATES: Value of twenty leading agricultural products imported during 1933-34 and 1934-35

(Ranked in order of importance in 1934-35)

Commodity	1933-34	1934-35
	Thousand dollars	Thousand dollars

Compiled in Foreign Agricultural Service Division.

a/ Includes wheat unfit for human consumption, barley, corn, and oats.

## AGRICULTURAL IMPORTS OF THE UNITED STATES, 1934-35, CONT'D

In the table beginning on the opposite page there are given statistics both of the volume and value of agricultural imports in 1933-34 and 1934-35. In these statistics it will be noted that a number of commodities show fairly large increases last year. Cattle, canned beef, butter, feeds and fodders, and some of the grains are among these. The severe drought of 1934 is largely responsible for the unusual increases evident for these commodities. On the other hand, the value of imports of some products which are normally imported in substantial volume, such as wool, flaxseed, and tobacco, declined.

UNITED STATES: Value of agricultural imports compared with total

Foreign Agricultural Service Division. Compiled from official records of the Bureau of Foreign and Domestic Commerce, and of the United States Tariff Commission.

- a/ Beginning January 1, 1935, excludes Virgin Islands except imports of sugar.
- b/ Less than 500.
- c/ Reported in value only.
- d/ Includes albumen n.s.p.f., integuments, rennet, and marrow crude.
- e/ Not separately classified prior to January 1, 1935.
- f/ January 1, to June 30.
- g/ Excludes barley, corn, oats and wheat for feed.
- h/ May 1 to June 30.
- i/ Not separately classified prior to September 3, 1934.
- j/ September 3 to June 30.
- k/ July 1 to December 31.
- l/ Includes Brazilian or pichurim beans; locust or carob beans; palm leaf, natural; tamarinds; tea waste; broomroot; inedible vegetable wafers; and vegetable glue.
